

ABSTRACT:

5 A device (100) (100) for browsing an image collection shows a continuously
scrolling sequence (102) of representations (200, 202, 204, 206, 208) of images and
commands in a browsing area (103). A user can select (105) a representation, which results in
the full image being shown in a display area (106), or in the command being executed. Speed
10 and direction of the scrolling (107) can be varied with an input stroke in the browsing area
(103). The representations (200, 202, 204, 206, 208) could be shown together with border
areas (201, 203, 205, 207, 209), which when selected limit the sequence (102) to the
representations (200, 202, 204, 206, 208) belonging to the same category as the
representation whose border area was selected. A general purpose computer can be
programmed to function as the device (100) (100) by means of a computer program product.
